

SYSTEM AND METHOD FOR COMMUNICATING WITH
STUDENTS IN AN EDUCATION ENVIRONMENT

ABSTRACT OF THE DISCLOSURE

10004949-126304

A communication system for communicating with students in an education environment includes a plurality of remote units, a base station that receives messages from the remote units, a processor, a memory, and a display simultaneously visible to all users of the remote units. The base station receives a response to a current question from a remote unit. The processor determines whether the current response is a valid response, and uses the display to visually indicate to a user of the remote unit whether the response is valid.
